

## **Green Growth and Low Carbon Development in East Asia**

**Fumikazu Yoshida, Akihisa Mori**  
**ISBN: 978-1-13-883264-0**

This is very interesting book which deals to explain the concept of green growth, coupled with one of green economy and low carbon development, that is a global concern especially in the face of the multiple crises that the world has faced in recent years - climate, oil, food, and financial crises, on the one hand and, on the other, how to assess in East Asia, this concept: is regarded as the key in transforming cheap-labour dependent, export-oriented industries towards a more sustainable development. The book is structured into three parts. The first one has the title “Energy Transition”. The second part has the title “Trade and Industrial Structural Change” and the third part, is under the title “Perspectives”. The book examines the beginnings of low carbon, green growth in practice in East Asia and how effectively it has directed East Asian nations, especially Korea, China and Japan, to put environment and climate challenges as the core target zone for investment and growth. Special focus is paid to energy and international trade - areas in which these nations compete with pioneered nations of Europe and the United States to develop renewable energy industries and enhance their international competitiveness.

In addition, the book extracts research material from original sources, not published before, to make those available to scholars and the general interested public. Finally, the book, discusses the applicability and limitations of this developmental approach taken by the developing nations and resource-rich emerging economies, including the conditions and contexts in which nations are able to transition into sustainable development through the use of low carbon, green growth strategies.
